Design Explanation

Personal Academic Portfolio Website
Student: Dana Majed Aljehani
Course: CS381 – Web Application Development

Website Overview

This project is a personal academic portfolio website designed to present my academic information, skills, projects, and contact details in a clear and organized way. The website was developed using HTML5 and custom CSS3 without using any frameworks or templates, as required in the assignment.

The website consists of three main pages: Home, Profile, and Contact, which are connected through a simple and consistent navigation menu.

Layout and Structure

The website uses semantic HTML elements such as header, nav, main, section, and article to create a clear and meaningful structure. This improves readability and accessibility.

The layout was created using CSS Flexbox and CSS Grid. Flexbox controls the overall page layout and alignment, while CSS Grid is used to organize sections like the profile content and projects.

Responsive Design

The website follows a responsive design approach to ensure that the layout works properly on different screen sizes. Media queries are used to adjust the layout for desktop, tablet, and mobile devices. For example, the projects section changes from multiple columns on large screens to a single column on smaller screens.

Accessibility and Visual Design

Basic accessibility practices were applied, including using alt text for images, labels for form inputs, and semantic HTML elements. The design uses a simple color scheme and clear section layout to create a clean and user-friendly interface.

Conclusion

This project demonstrates the use of semantic HTML, responsive CSS layout techniques, and accessibility considerations to build a functional personal portfolio website.
